

Class selectors are used to change **multiple** HTML elements at the same time. There is a dot before a class name.
e.g. **.panel**

Syntax

HTML:

```
<p class="text">
  Hello! How are you?
</p>
```

CSS:

```
.text {
  color: red;
}
```

- 1 Open **story.html** in your text editor and **inside** the **<head>** tags, **add** the code below.

```
<link rel="stylesheet" type="text/css" href="css/example.css">
```

- 2 Let's **add** class names to the **<div>** tags **inside** the **<body>** tags. Your **<div>** tags will now look like this:

```
<div class="panel">
  <div>
    
  </div>
  <p>First Panel</p>
</div>
<div class="panel">
  <div>
    
    <img />
  </div>
  <p>Second Panel</p>
</div>
<div class="panel">
  <div>
    <img />
  </div>
  <p>Third Panel</p>
</div>
```
