

- 4 **Create** a new CSS rule for **second-panel-image** with a hover selector and **use** the **changeShape** animation you made. It will look like this:

```
#second-panel-image:hover {  
  animation-name: changeShape;  
  animation-duration: 1s;  
  animation-iteration-count: infinite;  
}
```

Fun Exercise!

Create an animation for the image in the **third** panel using some of the things you learned from the previous steps?

Experiment with these values for the transform property to create your own animation.

rotate(angle)	rotates an element from 0-360deg. eg. rotate(90deg), rotate(60deg)
translate(x, y)	any value in pixels. eg. translate(10px, 15px)
scale(x, y)	scales an element's width and height. e.g. scale(2, 2) , scale(1.5, 1.5)
